# BlockHIE: a BLOcKchain-based platform for Healthcare Information Exchange

Shan Jiang\*, Jiannong Cao\*, Hanqing Wu\*, Yanni Yang\*,  
Mingyu Ma\*, Jianfei He†

\*The Hong Kong Polytechnic University, Hong Kong, China

†Huawei Technologies Co. Ltd., Shenzhen, China

# Table of Contents

- Background
- Preliminaries of BlockHIE
- Requirements to Publish and Share Data
- BlockHIE System Architecture
  - Two Loosely-coupled Blockchains
  - Mechanism and Structure of EMR-Chain
- System Implementation & Evaluation
- Conclusion

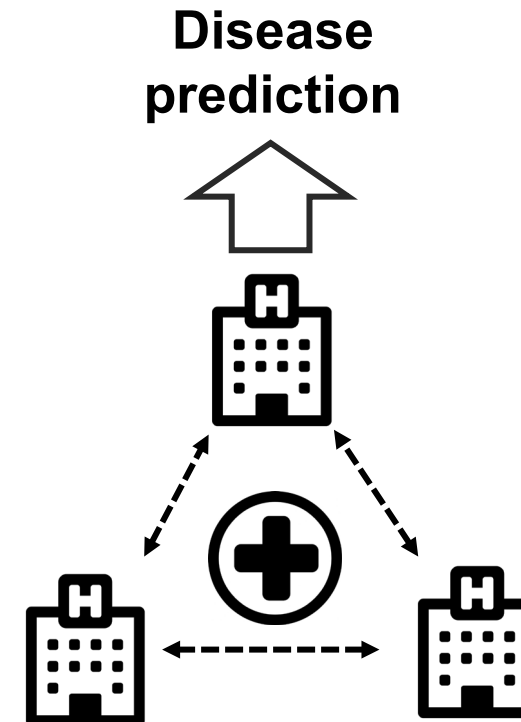

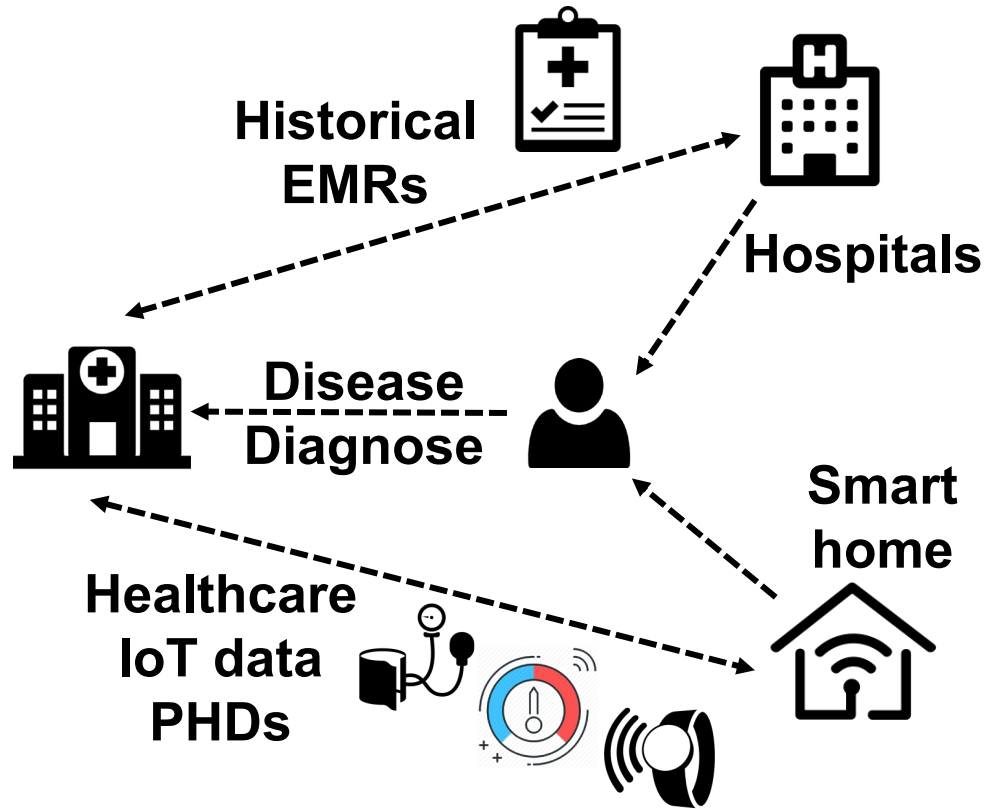

# Healthcare Information Exchange

- HIE
  - mobilization of health care information electronically across organizations within a region, community or hospital system.
- Goal
  - facilitate access to and retrieval of clinical data
  - provide safer and more timely, efficient, effective, and equitable patient-centered care.

# Healthcare Information Exchange

- Healthcare data sharing and exchange

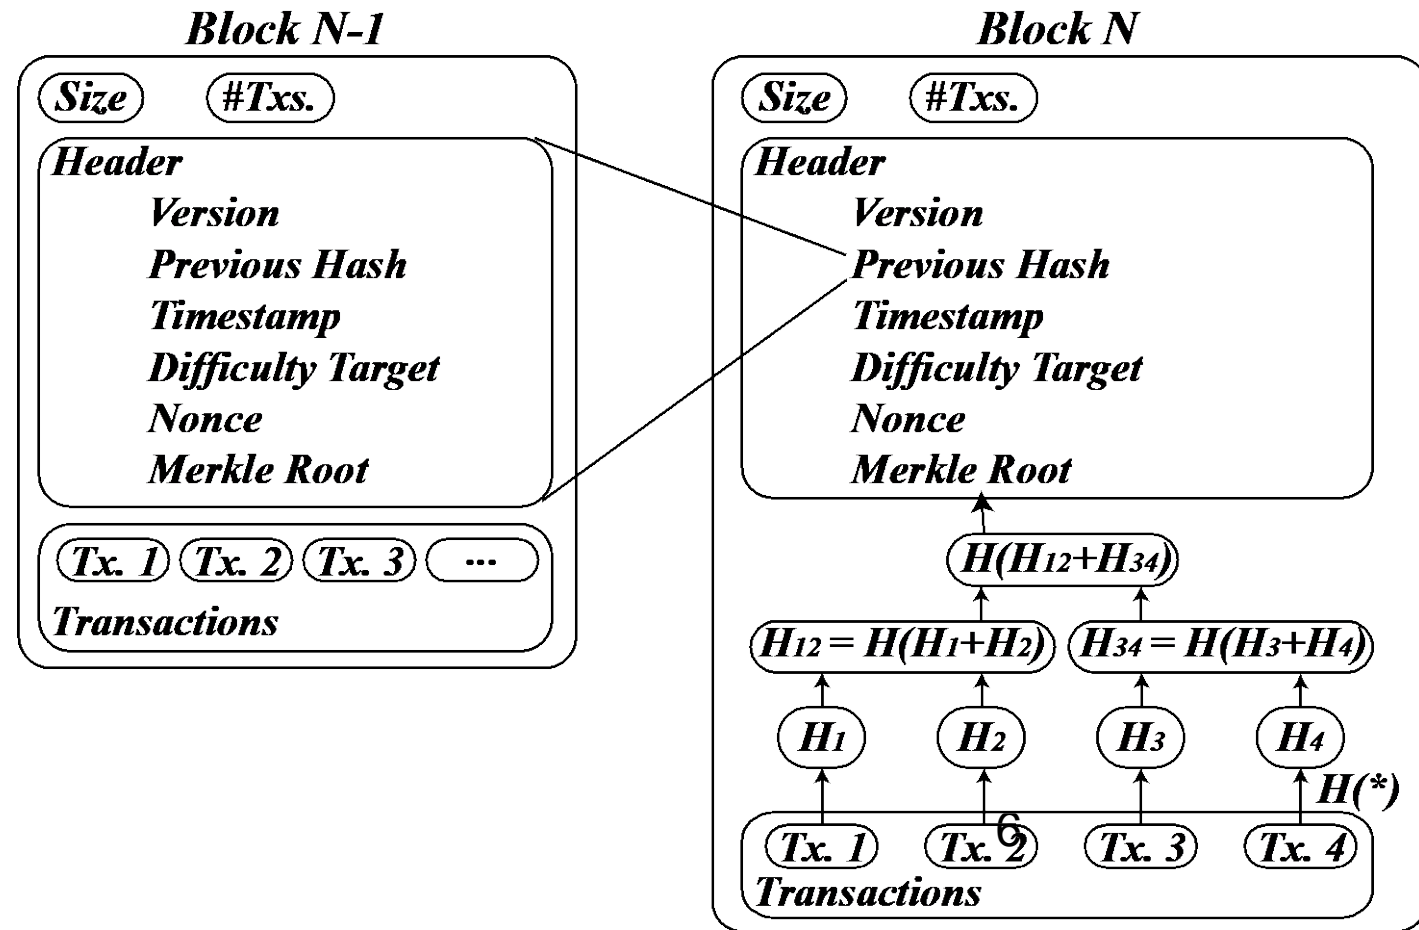

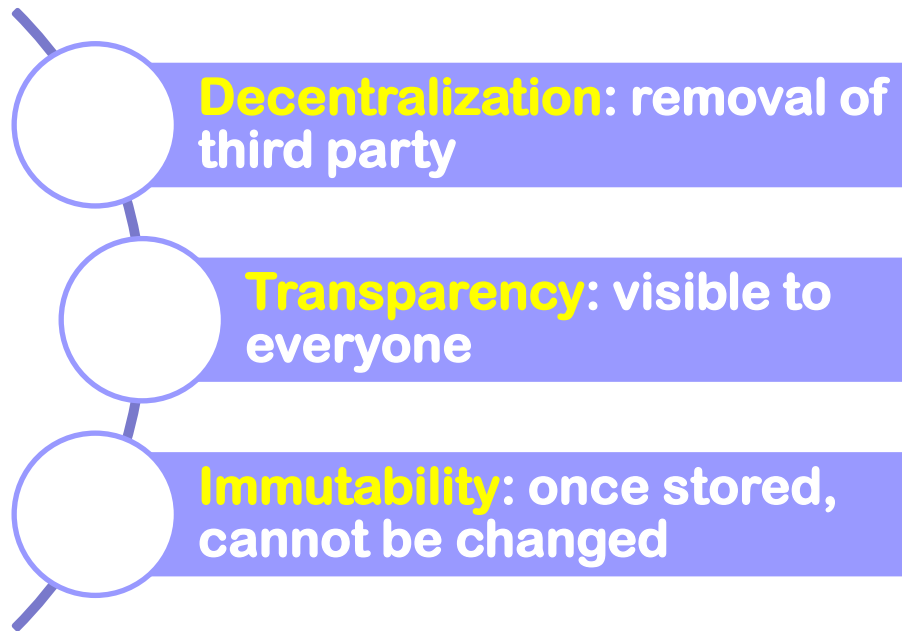

- EMR: Electronic medical records
- PHD: Personal healthcare data

# Existing Solutions

- Cloud service providers (CSPs) propose various schemes for reliable data storage and efficient data processing.
- CSPs have been taking great responsibilities to provide a controlled, cross-domain and flexible HIE platform.
- However, CSPs are unwilling to share their data.
- Risky if the healthcare is exposed to the malicious users unexpectedly

# Blockchain - Distributed Ledger Technology

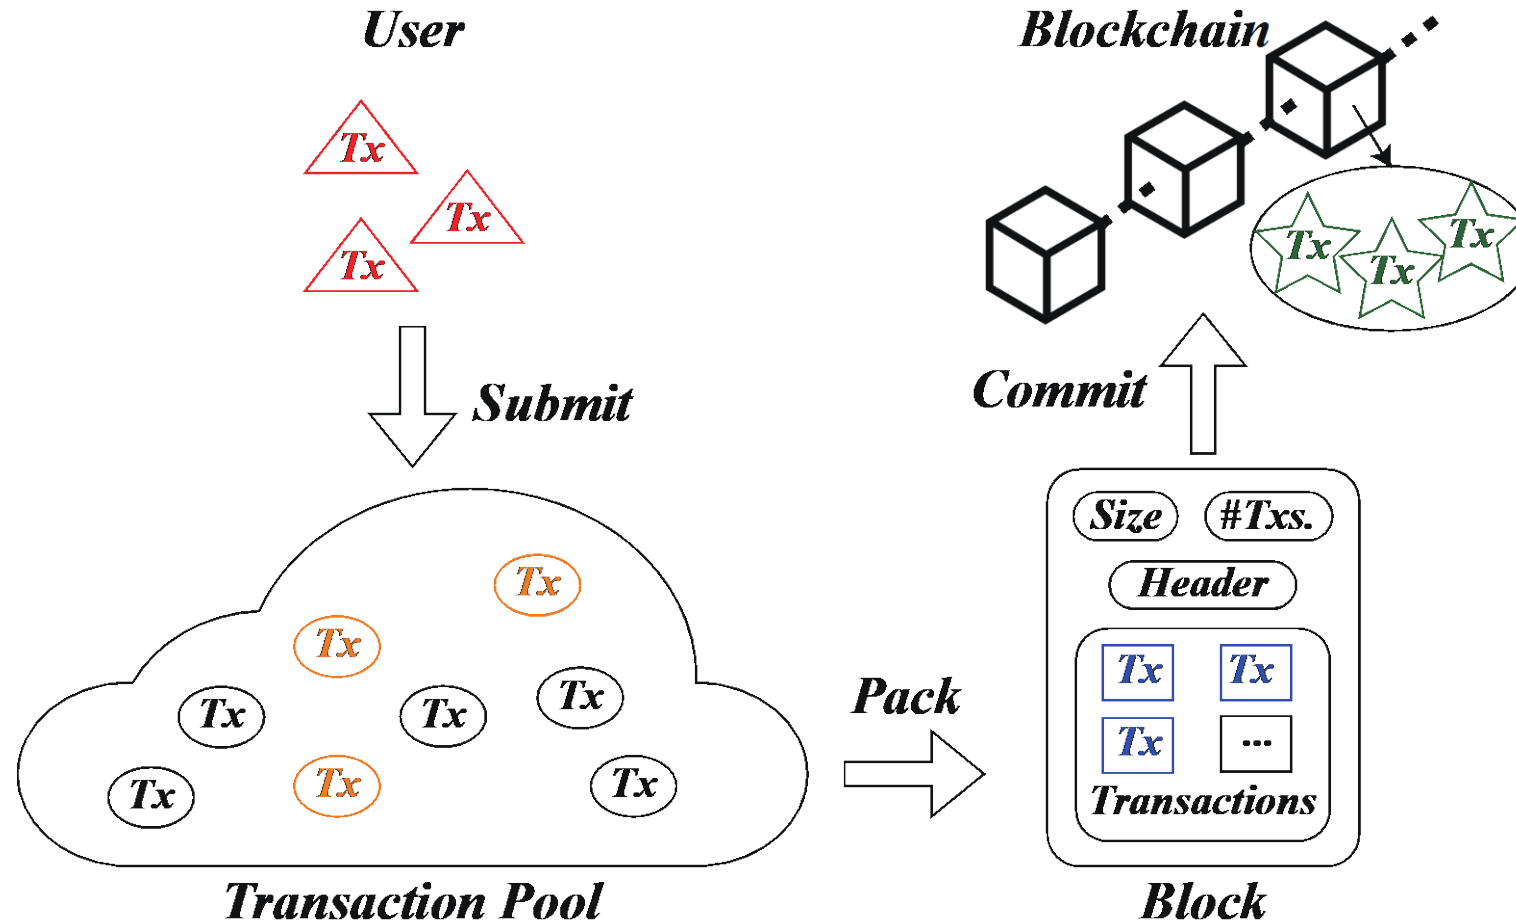

- A Blockchain is an append-only data structure, to store a continuously growing list of transactions.

# Distributed Consensus

- Consensus algorithm
  - members need to agree on a certain state of the Blockchain

# Requirements to Publish and Share Data

Requirements	EMR	PHD
privacy	high	moderate
authenticability	High	low
throughput	moderate	high
latency	moderate	moderate
fairness	moderate	moderate

# BlockHIE System Architecture

- Blockchain network
  - store and share healthcare data
- Medical institutions
  - submit diagnostic records
- Individuals
  - store and share healthcare data generated by IoT devices

## Two Loosely-coupled Blockchains

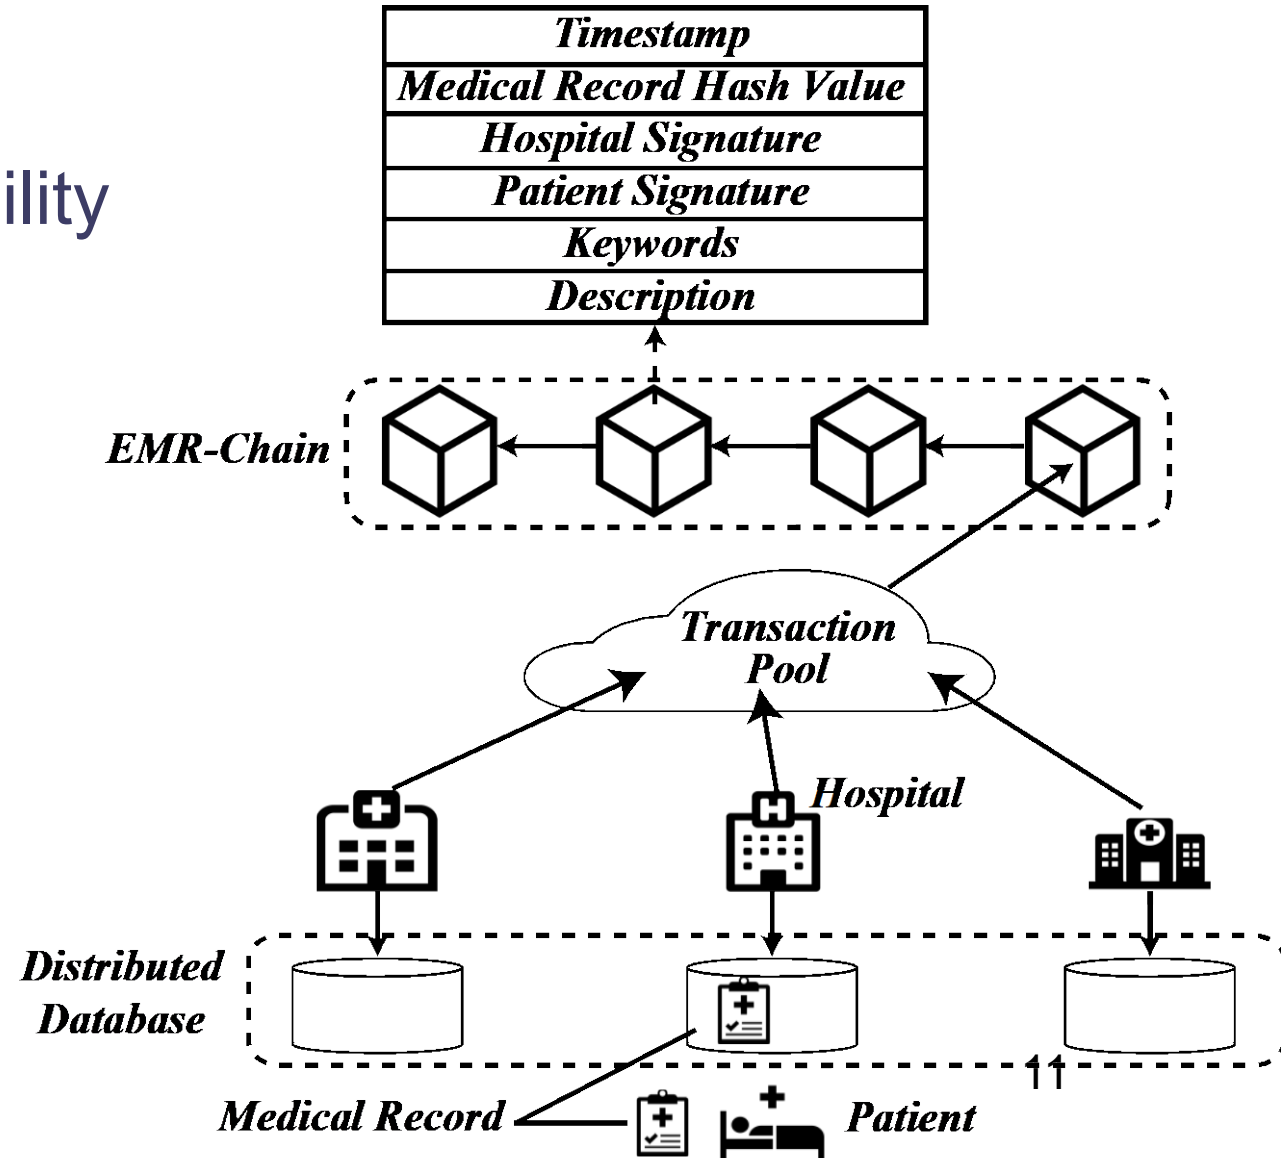

- Propose to store and EMR and PHD with two loosely-coupled Blockchains: EMR-Chain and PHD-Chain.

- Coupled when user publish data on both chains
- Identities of the same person can be different
  - EMR-Chain: unique record identifier
  - PHD-Chain: unique device identifier

# Mechanism and Structure of EMR-Chain

- Key requirements
  - Privacy and Authenticability
- Generate three copies
  - Hospital database
    - ▶ full copy
  - Patient
    - ▶ full copy
  - Blockchain Network
    - ▶ proof-of-existence copy

# Fairness-based Transaction Packing Algorithm

- Fairness-based packing algorithms in Blockchain
  - Data sharing applications can have different requirements, e.g., maximum throughput, maximum fairness
  - Propose algorithms to balance the throughput and fairness

$$t_i = e_i - s_i$$

- Fairness: 
$$\mathcal{J}(x_1, x_2, \dots, x_n) = \frac{(\sum_{i=1}^n t_i)^2}{n \cdot \sum_{i=1}^n t_i^2}$$

- Pack the TXs with top-m waiting times

# Fairness-based Transaction Packing Algorithm

- APP-Kth -SUM: An approximate algorithm to find the subset of size  $m$  with  $k$ -th largest sum in a set  $X$  of  $n$  positive real numbers
- EMR-Chain
  - TP&FAIR
  - high throughput and moderate fairness
- PHD-Chain
  - FAIR-FIRST
  - High fairness

---

**Algorithm 2** Throughput-first and fairness-first packing algorithm running on node  $i$

---

**procedure** TP&FAIR( $X$ )

$m \leftarrow$  the maximum number of transactions in a block

$X' \leftarrow$  APP-KTH-SUM( $X, |X|, m, i$ )

**return**  $X'$

**end procedure**

**procedure** FAIR-FIRST( $X$ )

$m \leftarrow$  the maximum number of transactions in a block

$X' \leftarrow$  APP-KTH-SUM( $X, |X|, m, 1$ )

**return**  $X'$

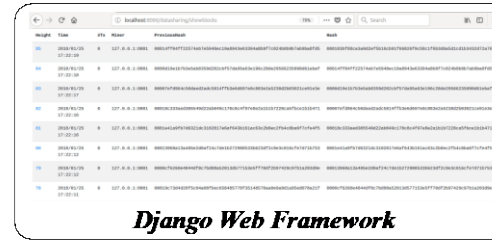

**end procedure**

---

# BlocHIE Implementation

- Implement BlocHIE in a minimal-viable-product version
- Three layers
  - Communication layer
  - Blockchain layer
  - GUI layer

GUI  
Layer

Django Web Framework

Blockchain  
Layer

```

gRPC-python
syntax = "proto2";
service Discovery {
  rpc ExchangeNode(Node) returns (Node);
  rpc Hello(Message) returns (Message);
}
service Synchronization {
  rpc BlockFrom(Message) returns (Block);
  rpc BlockTo(Block) returns (Message);
  rpc ExchangeBlock(Block) returns (Block);
  rpc TransactionTo(Transaction) returns (Message);
  rpc TransactionFrom(Message) returns (Transaction);
}
message Transaction {
  required bytes unixtime = 1;
  required bytes body = 2;
  required bytes txhash = 3;
  required int32 type = 4;
  required bytes txfrom = 5;
  optional bytes txto = 6;
}
message Block {
  required uint64 height = 1;
  required bytes unixtime = 2;
  required bytes previoushash = 3;
  required bytes blockhash = 4;
  required bytes difficulty = 5;
  required bytes answer = 6;
  repeated bytes txhash = 7;
  required bytes miner = 8;
  required int32 number = 9;
}
message Node {
  required int32 number = 1;
  repeated bytes ipport = 2;
}
message Message {
  required bytes value = 1;
}
    
```

Communication  
Layer

# Communication Layer

- Implemented using gRPC-python
- Two services
  - Discovery
    - ▶ peer discovery service
    - ▶ greet static nodes
    - ▶ exchange the connectivity info
  - Synchronization
    - ▶ synchronization service
    - ▶ remote procedure calls

## *gRPC-python*

```

syntax= "proto2";

service Discovery {
  rpc ExchangeNode(Node) returns (Node);
  rpc Hello(Message) returns (Message);
}

service Synchronization{
  rpc BlockFrom(Message) returns (Block);
  rpc BlockTo(Block) returns (Message);
  rpc ExchangeBlock(Block) returns (Block);
  rpc TransactionTo(Transaction) returns (Message);
  rpc TransactionFrom(Message) returns (Transaction);
}

message Transaction{
  required bytes unixtime = 1;
  required bytes body = 2;
  required bytes txhash = 3;
  required int32 type = 4;
  required bytes txfrom = 5;
  optional bytes txto = 6;
}

message Block{
  required uint64 height = 1;
  required bytes unixtime = 2;
  required bytes previoushash = 3;
  required bytes blockhash = 4;
  required bytes difficulty = 5;
  required bytes answer = 6;
  repeated bytes txshash = 7;
  required bytes miner = 8;
  required int32 number = 9;
}

message Node{
  required int32 number = 1;
  repeated bytes ipport = 2;
}

message Message{
  required bytes value = 1;
}
  
```

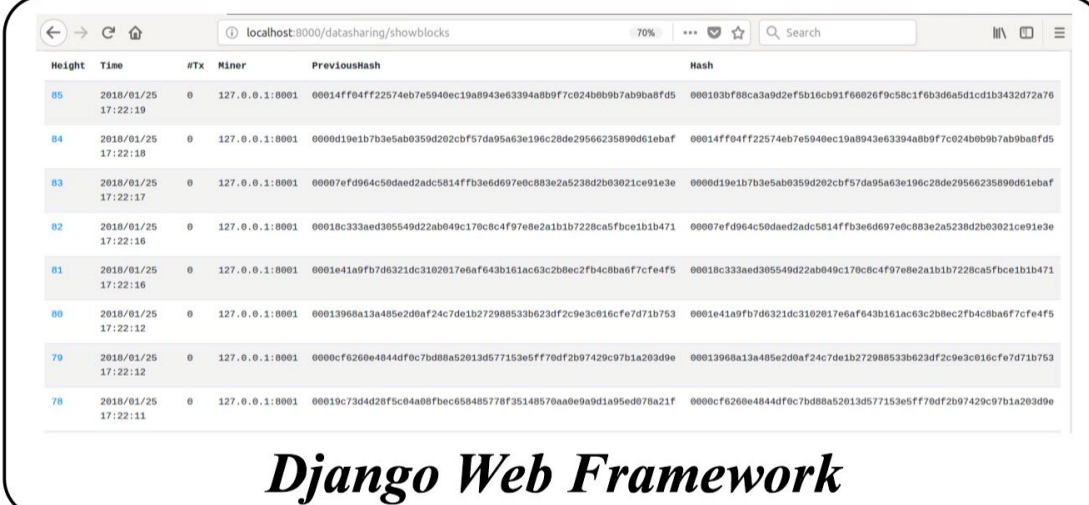

# Blockchain Layer

- EMR-Chain
  - FAIR-FIRST packing algorithm
- PHD-Chain
  - TP&FAIR packing algorithm
- Block Committing Algorithm
  - PoW

# GUI Layer

- Django web framework
- Open HTTP port and present HTML pages
- Submit data following the HTTP protocol

Height	Time	#TX	Miner	PreviousHash	Hash

*Django Web Framework*

# BlocHIE Evaluation

- Deployed BlocHIE with 8 nodes with tx frequency at 7 tx/s/node.

# Conclusion

1. Analyzed the requirements for storing and sharing EMRs and PHD
2. Propose two loosely-coupled Blockchain, EMR-Chain and PHD-Chain
3. Combine off-chain storage and on-chain verification in EMR-Chain
4. Propose two fairness-based transaction packing algorithms, FAIR-FIRST and TP&FAIR
5. Implement the BlochIE in a minimal-viable-product way
6. Evaluate the proposed packing algorithms extensively

# Acknowledgments

- This work is supported by Huawei Technologies Co. Ltd. with project code P15-0540 and RGC CRF with project number CityU C1008-16G.
